PROFILE

Frontend engineer with 4+ years shipping production software, currently at Moniepoint, one of Africa's largest fintechs, and previously lead engineer of a full e-commerce platform taken from code to live payments. I build screens and user journeys in TypeScript, React and Next.js to agreed designs, on shared component systems, wired to real APIs and backed by unit, component and end-to-end tests. I've led framework migrations (MERN to Next.js, React 19, Tailwind 4, Jest to Vitest), so I pick up new stacks fast. I already work across the stack, from Node.js APIs and payment integrations to CI/CD, security and production debugging, and I bring that experience in regulated financial products to every team I join.

- Shipped business-critical accounting features used by Moniepoint's business customers, and made their large data tables responsive under heavy use.
- Led a 49k-line TypeScript e-commerce platform end to end: storefront, admin, Paystack and Stripe payments, security, CI/CD and AWS deployment.
- Kept quality high with 250+ test files, Cypress end-to-end tests, CI on every pull request, and a 10% rise in coverage at Moniepoint.

TECHNICAL SKILLS

- **Frontend:** TypeScript, JavaScript, HTML5, CSS3, React 19, Next.js (App Router), Tailwind CSS, shadcn/ui, responsive layouts, forms and validation (Valibot), state management (Redux Toolkit)
- **Components and design systems:** reusable component libraries, shared design systems, microfrontends
- **APIs:** REST, HTTP, JSON, GraphQL (Apollo), Backend-for-Frontend with Node.js and Express
- **Testing:** Vitest, Jest, React Testing Library, Cypress (end-to-end)
- **Debugging:** browser dev tools, React DevTools, source maps, New Relic, OpenTelemetry
- **Secure frontend:** httpOnly cookie auth, CSRF and Content Security Policy protection, input validation, role-based access
- **Workflow:** Git, pull requests and code review, GitHub Actions CI/CD, Docker, Biome, ESLint
- **AI-assisted development:** Claude Code for implementation, refactoring and audits, with tests, typecheck and code review as guardrails

EXPERIENCE

Frontend Engineer — Moniepoint

December 2025 – Present · Fintech (payments, banking and business finance)

- Build and maintain screens and user journeys for business accounting features, including transactions, bills, savings, categories, profit-and-loss reports and chart of accounts.
- Integrate REST APIs into data-heavy financial tables and forms, handling loading, empty and error states so users can rely on what they see.
- Optimised table rendering by cutting unnecessary cell re-renders, batching updates with requestAnimationFrame and restructuring layouts with CSS Grid, so large tables stay responsive while scrolling and editing.
- Migrated tests from Jest to Vitest and raised test coverage by 10%; moved linting from ESLint to Biome.

- Helped upgrade the platform to React 19 and Tailwind CSS 4, fixing compatibility issues across shared components in a microfrontend setup.
- Added source maps across microfrontends so production errors trace back to the original code, speeding up investigations.
- Contributed to an Express.js Backend-for-Frontend with CSRF and Content Security Policy protection, keeping sensitive handling off the client.
- Investigate and fix production issues in feature flags, application loading and shared styling, and take part in code reviews.

Lead Full-Stack Developer — BAZ Studio

2022 – September 2025 · E-commerce

Lead engineer on a production platform selling in Nigeria and internationally: Next.js, React 19 and strict TypeScript, about 49k lines across 700+ source files.

- Led development of an e-commerce platform with a customer storefront and an admin back-office, from screens and APIs to deployment.
- Migrated the original MERN application to Next.js, and fixed layout shift (CLS) on the home page while adding SEO metadata.
- Built admin screens for products, inventory and orders with server-side search, pagination and URL-based filters, so every view can be shared and reloaded safely.
- Built a reusable component system with Tailwind and shadcn/ui, including dark mode, keeping logic in hooks so components stay simple and testable.
- Implemented checkout with Paystack and Stripe, with Valibot validation on every request plus recovery for missed payment webhooks and daily reconciliation.
- Designed the backend for reliability: an event-driven order pipeline with Kafka workers and retry handling, Redis caching, and feature flags that switch off risky features instantly.
- Added OpenTelemetry tracing and New Relic alerting so issues surface before customers report them.
- Secured the back-office with httpOnly cookie auth, two-factor sign-in, role-based access and audit logging.
- Maintained 250+ Vitest and Testing Library test files plus Cypress end-to-end tests, run in CI on every pull request before merge.
- Supported releases through an automated pipeline with Docker image scanning, deployment to AWS and post-deploy smoke tests, and wrote runbooks and architecture docs.

EDUCATION

BSc Electrical and Electronics Engineering — University of Ilorin, Nigeria · Second Class Upper Division
